Month	Strat %	QQQ %
2026-03	0.0	0.97
2026-04	9.16	13.02
2026-05	11.13	11.13
2026-06	-0.33	-0.33
2026-07	-1.44	-1.44

Strategy

AdaptiveMeanReversionBot is a fully systematic, rules-based strategy trading a single instrument — the QQQ Nasdaq-100 ETF. It is long whenever the 200-day trend is intact and volatility is calm (price > 200-day SMA and ATR below its 20-day average), and moves to cash only on a confirmed trend breakdown (price falls > 3% below the 200-day SMA). The buffered exit keeps the book invested through ordinary corrections and steps aside in sustained downtrends. It holds no leverage, no shorts and no overnight derivatives — exposure is either 100% QQQ or cash.

Execution

Signals are evaluated daily near the NYSE close and executed via Interactive Brokers. Fills in the track record include 0.05% one-way slippage. The book runs on a \$10,000 notional; returns are net of modelled trading costs.

Note on window

Since inception the strategy spent its first ~2.5 weeks in cash before its first long entry (9 Apr 2026), which explains the gap to QQQ buy-and-hold over this specific bull-market window.
